DATE:

January 29, 2019

SUBJECT: Parx Racing's Quarantine, Release our Position

Background and Our Understanding

We did on January 11th become aware of a diagnosis of *Equine Herpes Virus Type 1* (wild strain) being confirmed in a horse that had been removed from Parx Racing in Ben Salem PA on January 8. The diagnosis was based on clinical evidence of disease and detectable EHV1 DNA by a PCR assay. The animal's illness and associated diagnostics provides evidence that transmissible EHV-1 was prevalent on the backside and within the barn at the time the horse was removed January 8. Testing of the horses having the greatest probability of exposure (i.e. those residing in the same barn as well as outrider and lead ponies) was not conducted and our understanding is the quarantine put in place by Parx Racing is scheduled to be released on January 30 if no new cases are reported.

Our Position/Direction

In anticipation of the release on January 30, we have been conferring with our race tracks, horsemen and veterinarians regarding the undefined risk this population may pose. Lacking diagnostic testing to determine the extent of transmission to the exposed population, we (Dr. Stout and I) are of the shared opinion that, though the level of risk is unknown, we do feel that the risk is elevated. This determination is based on the fact that transmissible virus has circulated in the environment and is likely amplified in part by the extreme environmental factors that are decreasing exchange of fresh air into the barns. Additionally, an inability to adequately isolate new arrivals on the grounds of our tracks does warrant an abundance of caution be taken to mitigate the identified risk. With this being our opinion we are directing our tracks and their associated training centers to not allow movement of horses which have resided or been at Parx (racing, training or transiting, etc.), in the preceding 30 days. Horses from Parx will be allowed to enter KY and move to farms or private facilities where they can be isolated and further evaluated (which may include diagnostic testing) to potentially qualify for movement to a Kentucky track.

We will continue to monitor and report any developments as horses begin to depart Parx and are dispersed. Speaking with farms here in KY that may potentially get horses, I anticipate some will be tested and that could be helpful in defining what if any risk this population may pose.

This directive as currently set will remain in place through the week ending February 10th. We will next week make a determination if the directive should be extended or allowed to expire as scheduled.
